

Deliver a seamless, personalized patient journey

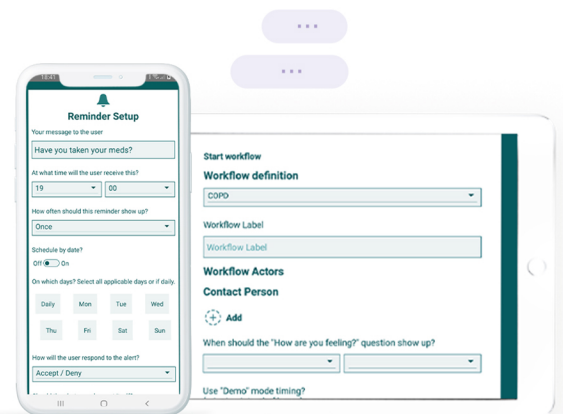

Care Pathway: The evidence-based tool for efficient care and enhanced health outcomes

How it works

The Aetonix Care Pathway maps out each step of a patient's care sequence to clearly communicate what action needs to happen and when. This enables seamless coordination within the circle of care, ensures smoother care transition, delivers clinical efficiencies, and improves overall health outcomes.

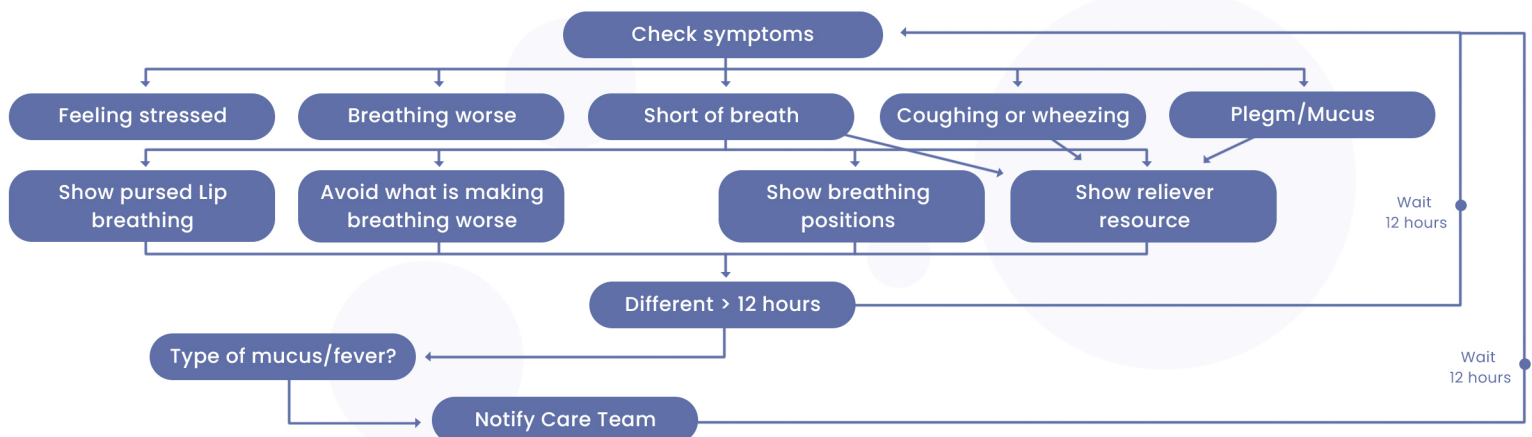

The tool provides the multidisciplinary healthcare team with workflows, forms and educational resources to facilitate and optimize each patient's journey. Every step in the care pathway can have multiple reactions based on the particular clinical outcome – the evidence-based care workflow responds intelligently with the appropriate adjustments to the patient's journey.

The Care Pathway is deployed on our virtual care platform, aTouchAway™, which works on PC, Mac, tablets and smartphones and complies with HIPAA, PHIPA and GDPR. It is available in multiple languages.

The Care Pathway improves health outcomes, strengthens the care experience and delivers clinical efficiencies throughout the entire patient journey.

Tailored to Conditions and Procedures

The Care Pathway is designed for specific patient journeys where the patient is suffering from one or more chronic diseases or undergoing a procedure or care transition. Workflows optimize the health outcome of a patient. The logic of the workflow, composed of actions and reactions, is taken from evidenced-based workflows developed by healthcare professionals.

Multidisciplinary & Patient-Centred

Complex care scenarios go beyond the doctor-patient relationship as it requires the cooperation from other care team members such as nurses, specialists, therapists and even family members. The Care Pathway takes into account all the interdependent relationships that are a part of the patient's journey. It enables the patient's circle of care to effectively and promptly exchange critical health information via forms. It fosters collaboration around the patient and keeps everyone on the same page.

Facilitates Coaching & Guidance

Different roles have different responsibilities in the patient journey. The Care Pathway allows the clinician to digitize any healthcare educational resources and upload them to the organizational library. These resources can be mapped to specific steps in the workflow to help guide the care team and directly educate and inform the patient and their family about the next steps in their journey.

Responsive Care Experience

The Care Pathway accounts for the different outcomes that may occur throughout the entire care spectrum. Depending on a certain reading, test result, or a reported symptom, patients can be directed to the relevant sequence in the workflow. As all protocols in the workflows are automated, it saves clinicians valuable time while ensuring evidence-based care. The dashboard provides a snapshot of trending patient data and allows clinicians to easily create reports when needed.

Real-Time, Intelligent Tracking

The Care Pathway allows clinicians to conveniently monitor patient and staff compliance remotely. All patient information like medication history, hospital visits, conditions, plan of actions are documented in the forms. Healthcare professionals are able to make notes about any changes to the care plan and document their observations and instructions. Patients' vital signs are recorded in real time and early warning signs can be detected to inform when a clinical intervention is necessary.

Customized Privileges

The Care Pathway has a role-based engine, where administrators can create roles for the healthcare team. These roles can vary in responsibility and have different levels of access -- ensuring appropriate coordination of patient care and access to patient information.
